Health Report

How to interpret Lucky's genetic health results:

If Lucky inherited any of the variants that we tested, they will be listed at the top of the Health Report section, along with a description of how to interpret this result. We also include all of the variants that we tested Lucky for that we did not detect the risk variant for.

A genetic test is not a diagnosis

This genetic test does not diagnose a disease. Please talk to your vet about your dog's genetic results, or if you think that your pet may have a health condition or disease.

Summary

Of the 273 genetic health risks we analyzed, we found 2 results that you should learn about.

P2Y12 Receptor Platelet Disorder

Lucky inherited one copy of the variant we tested for P2Y12 Receptor Platelet Disorder

What does this result mean?

This variant should not impact Lucky's health. This variant is inherited in an autosomal recessive manner, meaning that a dog needs two copies of the variant to show signs of this condition. Lucky is unlikely to develop this condition due to this variant because she only has one copy of the variant.

Impact on Breeding

Your dog carries this variant and will pass it on to ~50% of her offspring. You can email breeders@embarkvet.com to discuss with a genetic counselor how the genotype results should be applied to a breeding program.

What is P2Y12 Receptor Platelet Disorder?

This condition affects how blood platelets clump together, so bleeding may be heavier than expected after surgery or injury. Spontaneous bleeding is uncommon, but planning ahead for procedures is important.

When signs & symptoms develop in affected dogs

Signs may occur at any age but are most often recognized in young dogs during an elective surgery or following a trauma.

How vets diagnose this condition

Genetic or laboratory testing is necessary to diagnose P2Y12 deficiency. If you have a Greater Swiss Mountain Dog, you should absolutely test them for this disorder prior to surgery.

How this condition is treated

Currently there is no treatment for this disorder. If your dog must have surgery, your veterinarian should be prepared to provide multiple transfusions during and/or after the procedure.

Actions to take if your dog is affected

- Talk to your vet about your dog's genetic result, as it could impact upcoming surgeries or procedures.
- Be cautious with activities that could lead to injury, like rough play at dog parks or off-leash hikes.
- To help stop minor bleeding, such as from a broken nail, keep basic first-aid supplies on hand, including bandaging material and styptic powder.
- If your dog is injured, apply gentle pressure with gauze or a clean cloth to the wound. Keep your vet's contact information handy in case the bleeding doesn't stop within a few minutes.

Lucky inherited one copy of the variant we tested for Progressive Retinal Atrophy, prcd

What does this result mean?

This variant should not impact Lucky's health. This variant is inherited in an autosomal recessive manner, meaning that a dog needs two copies of the variant to show signs of this condition. Lucky is unlikely to develop this condition due to this variant because she only has one copy of the variant.

Impact on Breeding

Your dog carries this variant and will pass it on to ~50% of her offspring. You can email breeders@embarkvet.com to discuss with a genetic counselor how the genotype results should be applied to a breeding program.

What is Progressive Retinal Atrophy, prcd?

This eye condition causes gradual degeneration of the retina. Affected dogs typically lose night vision first, followed by progressive vision loss over time.

When signs & symptoms develop in affected dogs

The age affected dogs will first show signs of visual impairment varies by breed. However, most begin showing clinical signs in early adulthood.

How vets diagnose this condition

Veterinarians use a focused light to examine the pupils. In affected dogs, the pupils will appear more dilated and slower to contract. Your vet may also use a lens to visualize the retina at the back of the eye to look for changes in the optic nerve or blood vessels. You may be referred to a veterinary ophthalmologist for a definitive diagnosis.

How this condition is treated

Currently, there is no definitive treatment for PRA. Supplements, including antioxidants, have been proposed for management of the disease, but have not been scientifically proven effective.

Actions to take if your dog is affected

- Talk to your vet about your dog's PRA result so you can work together to plan their ongoing care and monitoring.
- Schedule regular eye exams with your vet or a veterinary ophthalmologist to monitor for changes or complications such as cataracts.
- If your dog's vision changes, help them adjust by keeping furniture and routines consistent, using verbal cues, and keeping them on a leash in unfamiliar areas.
- Products such as protective halos can also help dogs navigate safely if their vision declines.

Genetic Diversity and Inbreeding

Coefficient of Inbreeding (COI)

Genetic Result: 0%

Our genetic COI measures the proportion of your dog’s genome (her genes) where the genes on the mother’s side are identical by descent to those on the father’s side. The higher your dog’s coefficient of inbreeding (the percentage), the more inbred your dog is.

Your Dog’s COI

This graph represents where your dog’s inbreeding levels fall on a scale compared to both dogs with a similar breed makeup to her (the blue bars) and all purebred dogs (the grey line).

Genetic Diversity and Inbreeding

More on the Science

Embark scientists, along with our research partners at Cornell University, have shown the impact of inbreeding on longevity and fertility and developed a state-of-the-art, peer-reviewed method for accurately measuring COI and predicting average COI in litters.

About Embark

Embark Veterinary is a canine genetics company offering research-grade genetic tests to pet owners and breeders. Every Embark test examines thousands of genetic markers, and provides results for over 280 genetic health conditions, breed identification, clinical tools, and more.

Embark is a research partner of the Cornell University College of Veterinary Medicine and collaborates with scientists and registries to accelerate genetic research in canine health. We make it easy for customers and vets to understand, share and make use of their dog's unique genetic profile to improve canine health and happiness.
